

World Energy Outlook 2017

London, 14 November 2017

- Four large-scale upheavals in global energy set the scene for the new *Outlook*:
 - The **United States** is turning into the undisputed global leader for oil & gas
 - **Solar PV** is on track to be the cheapest source of new electricity in many countries
 - **China** is switching to a new economic model & a cleaner energy mix
 - **Electricity** is broadening its horizon, spurred by cooling, electric vehicles & digitalisation
- These changes brighten the prospects for affordable, sustainable energy & require a reappraisal of approaches to energy security
- There are many possible pathways ahead & many potential pitfalls if governments or industry misread the signs of change

India takes the lead, as China energy growth slows

Change in energy demand, 2016-40 (Mtoe)

Old ways of understanding the world of energy are losing value as countries change roles: the Middle East is fast becoming a major energy consumer & the United States a major exporter

China's impact on global energy markets, again

Change in world energy demand by fuel

Worldwide demand growth to 2040 would be twice as high without energy efficiency improvements: global trends are shaped by China's switch towards natural gas & low-carbon fuels

Solar PV forges ahead in the global power mix

Global average annual net capacity additions by type

China, India & the US lead the charge for solar PV, while the EU is a frontrunner for onshore & offshore wind: rising shares of solar & wind require more flexibility to match power demand & supply

The future is electrifying

Electricity generation by selected region

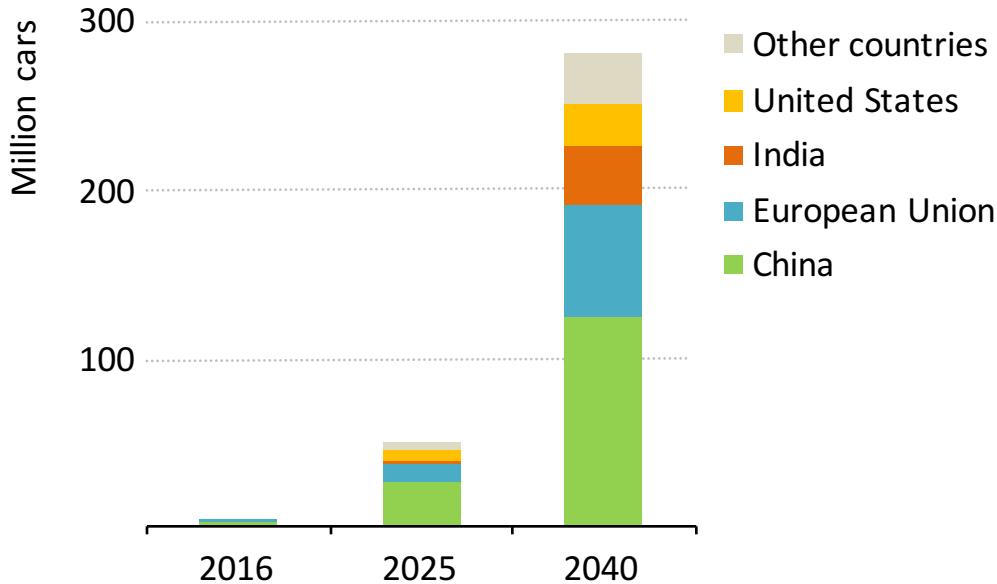

Sources of global electricity demand growth

India adds the equivalent of today's European Union to its electricity generation by 2040, while China adds the equivalent of today's United States

EVs are on the way, but oil demand still keeps rising

Electric car fleet

Change in global oil demand

Electric cars are helping to transform energy use for passenger cars, slowing the pace of growth in global oil demand: however, trucks, aviation, shipping & petrochemicals keep oil on a rising trend

Shale makes US the undisputed leader for oil & gas

Oil and gas production in the United States

The US is already switching to become a net exporter of gas & becomes a net exporter of oil in the 2020s, helped also by the demand-side impact of fuel efficiency & fuel switching

LNG ushers in a new global gas order

Gas importers

Asia's growing gas import requirements are largely met by LNG, with exports from the US accelerating a shift towards a more flexible, liquid global market

A new strategy for energy & sustainable development

The Sustainable Development Scenario reduces CO₂ emissions in line with the objectives of the Paris Agreement, while also tackling air pollution and achieving universal energy access

Stronger policies for a more sustainable world

The Sustainable Development Scenario in 2040

875

million electric
vehicles

2 times
more efficient
than today

3 250_{GW}

global solar PV capacity

580_{bcm}

additional gas demand

Only 15% additional investment is required to 2040 to achieve the Sustainable Development Scenario, with two-thirds of energy supply investment going to electricity generation & networks

- The oil & gas resurgence of the United States is shaking up the established order, with major implications for markets, trade flows, investment & energy security
- The versatility of natural gas means that it is well placed to grow, but it cannot afford price spikes or uncertainty over methane leaks
- China's continues to shape global trends, but in new ways as its "energy revolution" drives cost reductions for a wide range of clean energy technologies
- Our strategy for sustainable energy shows that concerted action to address climate change is fully compatible with global goals on universal access & air quality
- Electrification & digitalisation are the future for many parts of the global energy system, creating new opportunities but also risks that policy makers have to address
